Nguyen Anh Tuan

Full-Stack Engineer · *Available on 2 weeks' notice*

nguyenanhtuan200241@gmail.com | +33 6 69 08 83 59 | linkedin.com/in/tubanguyen | untergas.github.io

Profile

Since 2025 at a network security startup, in a team of two developers with no tech lead: I take each feature on my own from spec to production, working directly with the CTO. What I bring: features that ship with their tests, production problems fixed at the root cause, and a codebase that gets better instead of slower.

Experience

Snowpack (ZTNA) · TypeScript, Node.js, Docker, React, MongoDB — Paris
Full-Stack Engineer (fixed-term contract) — *05/2026 - Present*

- Production incident: emergency fix live the same day, both root causes removed within a week. **CPU from 100% at peak to 10-20% at most.** Task run durations now logged into the **Grafana** pipeline for better monitoring.
- Rebuilt how the backend runs: fixed the setup, from translated on the fly to compiled JavaScript on **Node.js 24** (from 18). Start-up **2.5 to 1.5 min**, every CI pipeline **1-1.5 min** faster, image **30%** smaller.
- Self-hostable console, for a client to install the whole Snowpack infrastructure offline: one **Docker Compose** stack, tested on **AMD64** and **ARM**. Wrote the install guide: our devs set up the **internal testing pipeline** from it alone.

Full-Stack Developer (internship) — *02/2025 - 03/2026*

- Group-based access, full ownership from spec to implementation: **bulk assignment** of users and devices to services, **access resolution** and **licence distribution** across groups. First release in under **2 months**, with **42 end-to-end scenarios** and **48 role-permission checks**.
- Identity providers (**Keycloak**, **Microsoft Entra ID**): each company's groups and members kept up to date with its identity provider, every 5 minutes and at sign-in. Fixed an **SSRF** vulnerability (blocked internal addresses).
- Faster data loading on every console page: users page **10-15 s down to 4-5 s** (**2-3x faster**), by replacing a shared "reload everything" with per-page loading and a short cache.

Projects

RFP proposal scorer (24h hackathon, team of 4) — Frankfurt
Architecture lead, Python (FastAPI), React · github.com/UNtergas/SiviHack-2026-Team — *09/2026*

- AI reviewer for sales proposals: rules in code for amounts and dates; the AI model (Gemini Flash) scores **7** criteria and must quote the proposal; code checks each quote exists.
- Tested on **10** real public bids (Michigan): matched the State's ranking on **2 of 3** contracts, under **$0.60** per bid.
- Pipeline: RFP extracted once (cached) → **3** parallel scoring groups, JSON schema → weighted score in code.

Appius, city-builder game (team of 6) — INSA Centre Val de Loire
School project, Python · github.com/jumscrafteur/appius — *10/2022 - 01/2023*

- Split the tasks and gave everyone time to contribute. Three weeks before the deadline, took the rest in hand and wrote **about three quarters of the code**.
- **Core engine of the main game**: in-game events (fire, housing, walkers, patrols, water), **A* pathfinding**.
- Rendering: **map pre-rendered once, only changed tiles redrawn** (frame rate), 4 draw layers, minimap.

Technical Skills

Programming languages: TypeScript, JavaScript, Python, SQL
Backend: Node.js, Express, TSOA, FastAPI, REST, OpenAPI / Swagger, MongoDB, TypeORM
Frontend: React, Next.js, Vite
Security & Identity: authentication, RBAC, application security, Keycloak, Microsoft Entra ID
Tools & DevOps: Git, pnpm, Linux, Bash, Docker, Docker Compose, GitLab CI, Grafana, Node SEA
Testing & practices: Vitest (TDD, end-to-end), k6, Agile, object-oriented programming (OOP), code review
Spoken languages: English C1 (TOEIC 970/990), French B2 (DELF B2, 72.5/100), Vietnamese native

Education

INSA Centre Val de Loire — Bourges
Engineering degree, Security and Information Technology — *2022 - 2026*

Selective Franco-Vietnamese integrated preparatory programme, Hué — *2020 - 2022*
